CYP450 Activity Assessment: Metmax™ pooled human enterocytes were thawed in a 37°C water bath. A 1000 μL Eppendorf pipette (with tip) was used to pipet up and down three times to achieve homogeneity. MetMax™ enterocytes were prepared at a density of 2 million cells per mL. Equal volumes of MetMax™ enterocytes and 2X substrate were incubated for 60 minutes with isoform-selective substrates at 37°C. The final cell density of Metmax™ enterocytes and substrate was 1.0 million cells/mL in a 96-well plate (96 well plates pre-loaded with 50 μL of 2X substrates per well, and metabolism initiated by adding 50 μL of MetMax™ enterocytes to each of the wells, 100,000 enterocytes /well). The metabolites were identified and analyzed using LC-MS/MS.
