**Characterization:** Hepatocytes were thawed using 37°C UCRM™ and centrifuged for 10 minutes at 100g. After removing the supernatant, hepatocytes were re-suspended in UPCM™ and counted for viability and yield using the Trypan Blue exclusion method. Cells were plated at a density of 0.7 million cells per mL in a hand-coated collagen plate and allowed to attach 4-6 hours prior to a Matrigel® overlay.

### P450 Induction

Drug Metabolizing Enzyme	Inducers (µM)	Fold Induction (Gene Expression)
CYP1A1	3-methylcholanthrene (2)	2.6
CYP1A2	3-methylcholanthrene (2)	1.9
CYP3A8	Rifampin (10)	8.4
CYP3A8	Phenobarbital (500)	9.7

**CYP450 Induction Assessment:** 96 well cultures at a cell density of 0.5 million hepatocytes/mL (50,000 hepatocytes/well) were used in the CYP450 induction assessment. The hepatocytes were cultured as collagen-Matrigel® sandwich for 1 day followed by treatment duration of 48 hours for mRNA using known enzyme inducers. After the treatment period, cells were harvested and gene expression was quantified by RT-PCR. Values reflect mean and standard deviation of triplicate treatments (N=3).

### Photomicrographs (100X, Phase Contrast)

#### Phase Contrast Initial Attachment

#### Phase Contrast Day 4

**Monolayer Comments:** 10369013 has a good attachment efficiency at 70 % and continues to develop a monolayer confluency of 100 % by day 3. This lot exhibits good morphology and remains intact for 5 days in culture.
